If you wish to remove unwanted areas in an image, select the area you wish to mask and then go to Image > Adjustments > Reverse Mask. Alternatively, you can reverse the unwanted area using Magic Wand select, make a reverse selection, and then go to Select > Inverse.

In the old days, version 1, you hand-tuned your image in the creative toolbox to get it just right, and then refined the drawing over and over until it was perfect. The whole thing took days. You may have had your image on screen, viewing it as a small thumbnail, or you may have been perfecting some of the drawing and left the image in, because if you hadn't been happy with the way the image looked, there was no point in trying to draw what you had in mind. Now, you'll be able to click the image, get instant access to the original, and watch a history on the image, an undo history, which you can cancel and redo until it looks just the way you want it, or preview it from any orientation and any size, and make small changes to the image without starting a new file. Real time keying lets you overlaid the image and fill in any areas that you'd like, even if it's a totally blank canvas. Those selection tools that were once shared were gone, but text, paths, and symbols were all born.

Rejoice, because in CS3 you get rules, group and mask selection, live preview, and layer comps. The old multipass dialog box, which was discontinued back in 2001, has returned, and is probably the single biggest improvement in Photoshop that's come to users for the past decade. Click, you can make specific adjustments to the image, such as applying Gaussian, Curves, or Highlights and Shadows. But that's not all. Use Live-Preview to see what it will look like at a range of resizes or when you apply the adjustment, and you'll see that your image has been adjusted just the way you want it in real time. Not only that, but you'll also be able to activate the adjustment state for all your image layers.
