The latest version adds a whole new and useful "blank canvas" smart object tool. You can use this feature to place just about any type of smart object in any image so that you can manipulate it via edits. Smart objects have been available from Apple in its iPhoto, and have been available in Adobe's Photoshop for many years. What's new in Lightroom is the ability to create a new smart object (by simply creating a new layer on top of a RAW file), edit it, then drop it into any other image as needed. Most RAW editors have similar smart object features. Guess what? Photoshop Elements is the first major release to include this. No! That's not right! It's the **first major release to support it**. It should not be surprising that Adobe is first with a new feature; they have brought the feature a few years earlier than Apple. It's all about getting to the right tool first, by Mr. Jobs. To be fair, I have not seen this tool as being of any use yet, as I haven't even done very much with it yet. Nevertheless, it is most welcome.

There have been many new camera features added to Lightroom in 5, too, most of which are now standard in the editing program. However, the most interesting addition may be a new "HDR+" option. This is just a fancy way of saying "high dynamic range photography." It pulls a trick that is common in nature photography; it combines many different exposures of the same subject into a single RAW file to get the right tonal range. It sound like magic, but it happens every time.

It's easy to jump into the topic of RAW. The Adobe Photoshop file format, PSD, is a very standard file, unlike JPEG, which is proprietary to Adobe. You can exchange your processed photographs with others via the standard PSD format. It's versatile, reliable, and versatile.
