PNG (Portable Network Graphics) format is a compressed image format used to represent raster graphics on the Internet. The PNG format is based on the Lempel-Ziv algorithm and offers a lot of options for compression. In addition, PNG image files contain a set of chunked data, providing information about the image, such as the dimensions, resolution, color palette, transparent pixels and compression method. A very important advantage of PNG format is that you do not need any additional file to open it. It will work directly on top of any Internet browser, making them able to display this format of files. The image file can be displayed in color, gray scale, full-color, among other options, even though the official standard is only able to provide color images. The pngcheck application is specifically designed to verify the integrity of PNG images. After checking the files, pngcheck will inform you if the image contains any errors and gives you the chance to correct the problems and, if needed, save the images in a different format (TIFF, JPEG, GIF and others). In case of error, the program will also print out an explanation of why the file was marked as bad.
